

Task 2. Vigenère Cipher

Available marks: 16

The Vigenère cipher, used to encrypt messages, was invented in 1553 and wrongly attributed to Blaise de Vigenère. It's based on the very simple Caesar cipher, where each letter is replaced by another a fixed distance along the alphabet, wrapping around if necessary. In the Vigenère cipher, a password known to the sender and receiver is used along with a table of all 26 Caesar ciphers to determine each replacement letter.

The way a message is encrypted into ciphertext is first to write it down in capitals (without any punctuation), and write the password below it, repeated as often as required. Then use each character of the repeated password to encode the corresponding message character. For example, the following encodes the message "Meet me at midnight" using the password "spook":

Message: MEETMEATMIDNIGHT

Password: SPOOKSPOOKSPOOKS

Ciphertext: ETSHWWPHASVCWURL

	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S	T	U	V	W	X	Y	Z

The first two encryption steps are circled in red on the table. The first ciphertext character ("E") is at the intersection of the "S" row and the "M" column, then "T" is at the intersection of the "P" row and the "E" column and so on. To recover the message, apply these steps in reverse.

Your Task

You have intercepted an encrypted message, along with a code book that contains 1000 passwords. Naturally you want to discover the message. Unfortunately you don't know which password was used, so (unless you intend to crack the code from first principles) you'll have to try all of them in turn. Fortunately the message is in English and contains the word "attack" several times.

Write a program that reads an encrypted message and a file of potential passwords, and displays the decrypted message in lower case (which is easier to read) using the information above to decide which password was used to encrypt the text. You may use character-code calculations rather than an explicit table.

Assessment

The file task2crypt.txt contains the ciphertext in upper case, split over several lines. No line is longer than 80 characters. The file task2passwords.txt contains the passwords, one per line, in lower case. No password is longer than 20 characters.

When you believe you have completed this task, show the judges the program and its output. You don't need to break the message up into words.
